Modeling Journal

3/2

Today in recitation I did some research on how I want to execute my project and found the inspo above. I knew I wanted to do a moose head just because I think it's cute and I know a place on my wall I would put it. I started by making the base plate by annotating a reference picture then making a plane the same shape. I did the same for the outline of the moose head and then solidified both of them.

3/5

Today I'm at a coffee shop just working on this project. My focus today is to get 75% of the project done before recitation Thursday. I already have it all planned out so right now I'm just working on getting the slot of the head done so in recitation I can work on getting it to print format and making it look perfect. I also made my reservation for the laser cutter in the art building for Friday so I can have it done early in case something goes wrong.

3/9

I finished my moose head and now I just have to put the slots in.

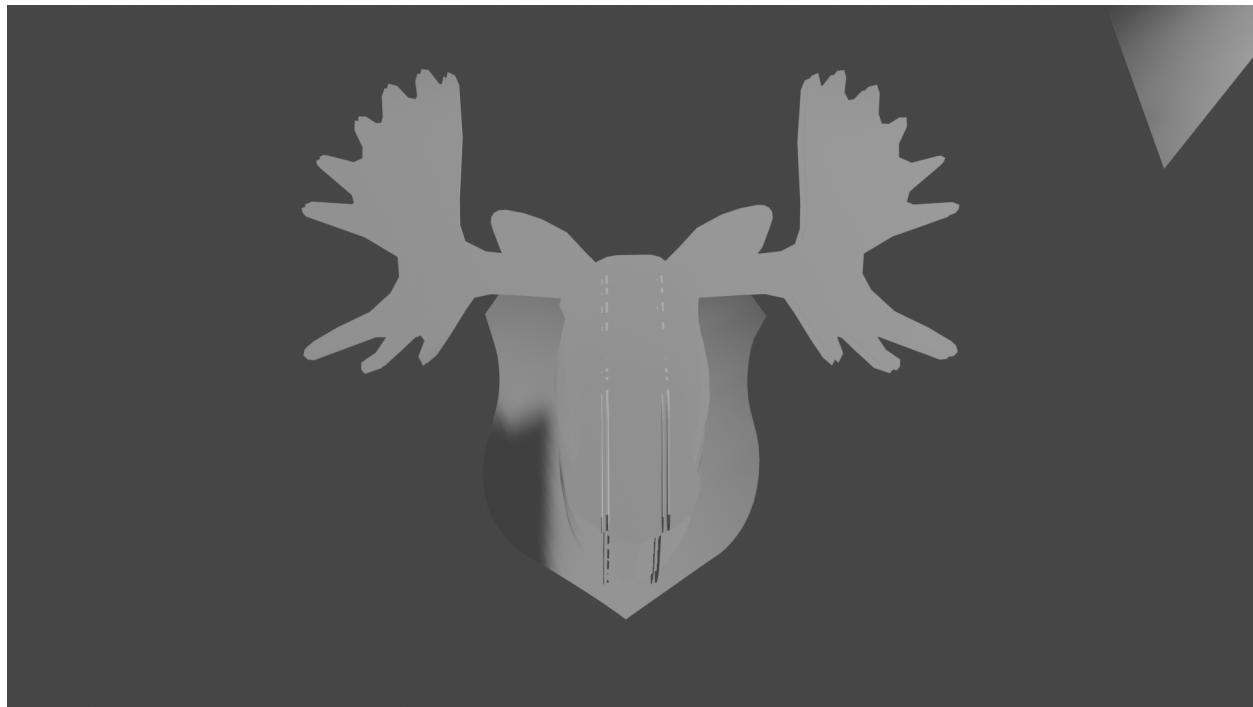

3/11

I did the slots pretty easily just by copying the pieces and subtracting them and hiding them.

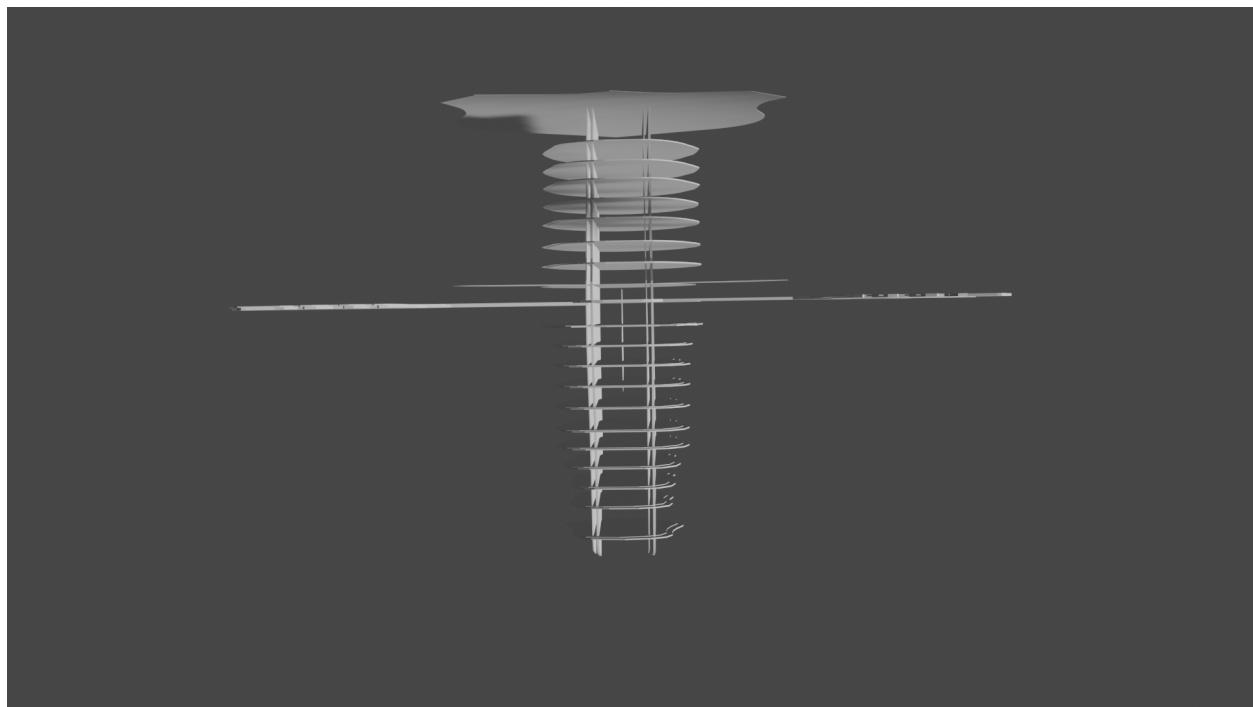

3/13

Now it's time to do the flat layout which I'm really not excited for because I feel like it will take forever.
